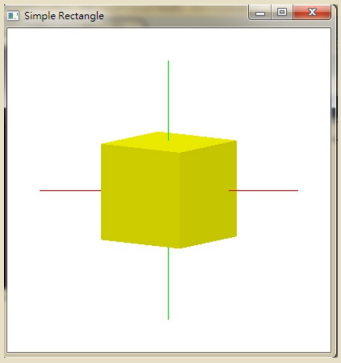
INTRODUCTION TO COMPUTER GRAPHICS

Vector, Matrix & Transformations

1

Goal

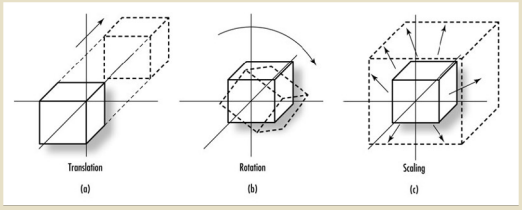
- Translation
- Rotation
- Scaling

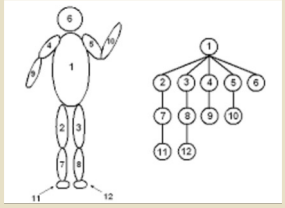


2

Transformations

- Why use transformations?
  - Create object in convenient coordinates
  - Reuse basic shape multiple times
  - Hierarchical modeling
  - Virtual cameras





3

Translation

$$T(t_x,t_y,t_z)\begin{bmatrix}x\\y\\z\end{bmatrix}=\left[\begin{array}{cccc|c}1&0&0&t_x&x\\0&1&0&t_y&y\\0&0&1&t_z&z\\0&0&0&1&1\end{array}\right]$$

4

Rotation

$$R_x(\theta) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{bmatrix}$$

$$R_y(\theta) = \begin{bmatrix} \cos\theta & 0 & \sin\theta \\ 0 & 1 & 0 \\ -\sin\theta & 0 & \cos\theta \end{bmatrix}$$

$$R_z(\theta) = \begin{bmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

The call glRotate(Θ, 1, 0, 0) generates R_x as follows:

$$R_x(\theta)\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \left[\begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta & 0 \\ 0 & \sin\theta & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{array}\right]\left[\begin{array}{c} x \\ y \\ z \\ 1 \end{array}\right]$$

5

Scaling

$$S(s_x, s_y, s_z)\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \left[\begin{array}{cccc} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{array}\right]\left[\begin{array}{c} x \\ y \\ z \\ 1 \end{array}\right]$$

8

Unit Vector

- The Euclidean distance of u from the origin is:
  - $||u|| = \text{sqrt}(x^2+y^2+z^2)$
  - denoted by $||u||$
- if $||u|| = 1$, then u is a unit vector,
- Normalization:

$$v = \frac{u}{||u||}$$ ----- unit vector

9

Vector Spaces

- Consists of a set of elements, called vectors
- Two operations are defined on them
  - Addition
  - Multiplication

10

Vector Addition

Given V = [X Y Z] and W = [A B C]

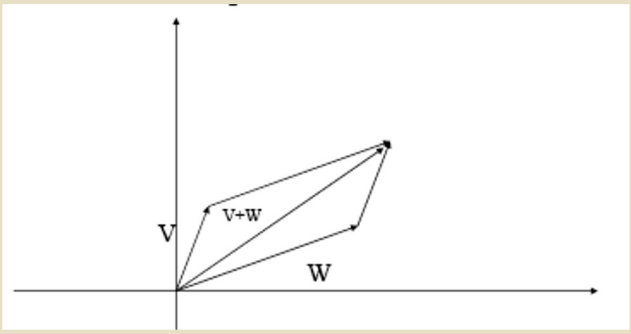
- V+W = [X+A Y+B Z+C]

- Properties of Vector addition:
  - 交換律 Commutative law: V+W=W+V
  - 結合律 Associative law : (U+V)+W = U+(V+W)
  - Additive Identity: V+0 = V
  - Additive Inverse: V+W = 0, W=-V

11

Vector Addition

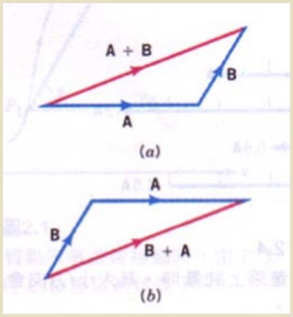
- Parallelogram Rule (平行四邊形)
  - To visualize what a vector addition is doing, here is a 2D example:



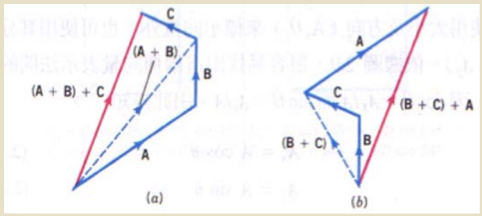
12

Vector Addition

Commutative law:
A+B=B+A



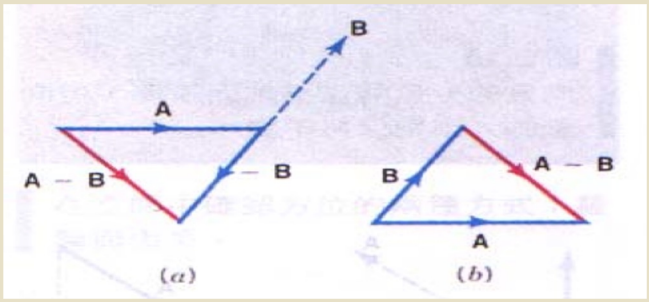
Associative law : (A+B)+C = A+(B+C)



13

Vector Addition

- Vector Subtraction is a special case (向量的減法可視為加法的特例)
  - A-B=A+(-B)



14

Vector Multiplication

Given V = [X Y Z] and a Scalar(純量) s and t

- sV = [sX sY sZ]

- Properties of Vector multiplication:
  - 結合律 Associative: (st)V = s(tV)
  - 純量分配律 Scalar Distribution: (s+t)V = sV+tV
  - 向量分配律 Vector Distribution: s(V+W) = sV+sW
  - Multiplicative Identity: 1V = V

15

Dot Product & Distances

Given u = [x_1 y_1 z_1] and v = [x_2 y_2 z_2]

- 內積: $v \bullet u = x_1x_2 + y_1y_2 + z_1z_2$

- The Euclidean distance of u from the origin is:
  - $\text{sqrt}(x_1^2+y_1^2+z_1^2)$
  - denoted by $||u||$
  - $||u|| = \text{sqrt}(u \bullet u)$

- The Euclidean distance between u and v is:
  - $\text{sqrt}((x_1-x_2)^2+(y_1-y_2)^2+(z_1-z_2)^2)$
  - denoted by $|| u-v ||$

16

Dot Product

Properties:

- Given a vector u, v, w and scalar s
  - The result of a dot product is a SCALAR value
  - Commutative: v•w = w•v
  - Non-degenerate: v•v=0 , only when v=0
  - Bilinear: v • (u + sw) = v•u + s(v•w)

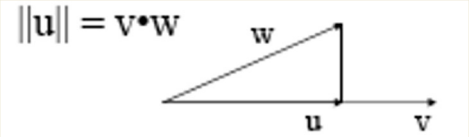
17

Angles and Projection

Alternative view of the dot product:

- v•w=||v|| ||w|| cos(θ)
  - where θ is the angle between v and w

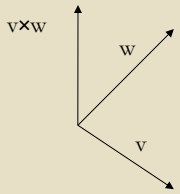
- If we perpendicularly project w onto v
  - If v is a unit vector (||v|| = 1)
  - Then the projected vector u : ||u|| = v•w



18

Cross Product

- The cross product of v and w: v x w
  - is a VECTOR, perpendicular to the plane defined by v and w
  - ||v x w||=||v|| ||w|| sinθ
    - θ is the angle between v and w
  - vxw=-(wxv)



19

Uses of the Determinant?

- Linear Independence of columns in a matrix
- Cross Product
  - Given 2 vectors v=[v_1 v_2 v_3], w=[w_1 w_2 w_3], the cross product is defined to be the determinant of

$$\begin{vmatrix} i & j & k \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} = \begin{pmatrix} v_2w_3 - v_3w_2 \\ v_3w_1 - v_1w_3 \\ v_1w_2 - v_2w_1 \end{pmatrix}$$

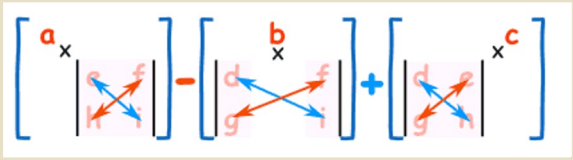
Determinant of a Matrix

$$A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

$$\det A = |A| = \sum_{i=1}^{n} (-1)^{1+i} A_{1i}$$

|A| = a(ei - fh) - b(di - fg) + c(dh - eg)



http://www.mathsisfun.com/algebra/matrix-determinant.html

27

$$C = \begin{bmatrix} 6 & 1 & 1 \\ 4 & -2 & 5 \\ 2 & 8 & 7 \end{bmatrix}$$

$$|C| = 6\times(-2\times7 - 5\times8) - 1\times(4\times7 - 5\times2) + 1\times(4\times8 - (-2)\times2)$$

$$= 6\times(-54) - 1\times(18) + 1\times(36)$$

$$= \mathbf{-306}$$

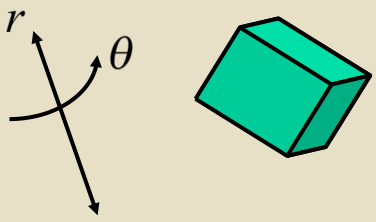
Arbitrary rotations

61

Rotations about an arbitrary axis

Rotate by θ around a unit axis r

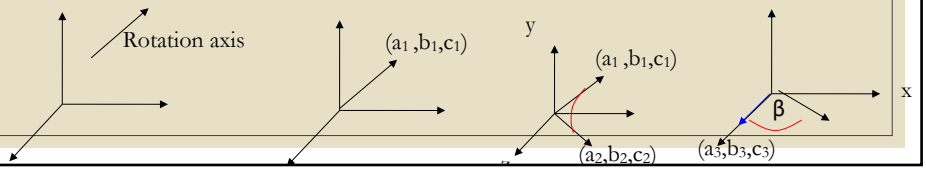


62

Rotation about an arbitrary axis

$$rot_{axis}(\theta) = \begin{pmatrix} a' \\ b' \\ c' \end{pmatrix} = T^{-1}R_x^{-1}(\alpha)R_y^{-1}(\beta)R_z(\theta)R_y(\beta)R_x(\alpha)T\begin{pmatrix} a \\ b \\ c \end{pmatrix}$$

- Translate the space so that the origin of the unit vector is on the world origin
- Rotate such that the extremity of the vector now **lies in the xz plane** (x-axis rotation)
- Rotate such that the point **lies in the z-axis** (y-axis rotation)
- Perform the rotation around the z-axis
- Undo the previous transformations

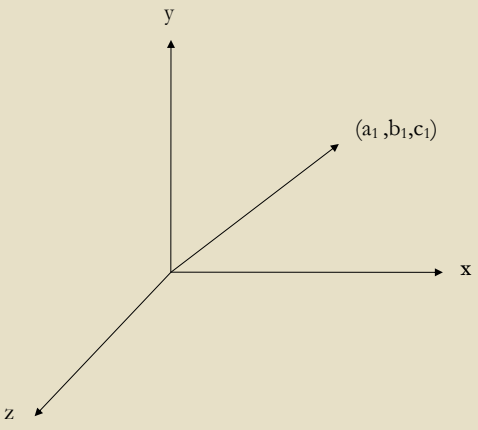


75

Rotation about an arbitrary axis

- Step 1: Translate the space so that the origin of the unit vector is on the world origin

$$\begin{pmatrix} a_1 \\ b_1 \\ c_1 \end{pmatrix} = T\begin{pmatrix} a \\ b \\ c \end{pmatrix}$$



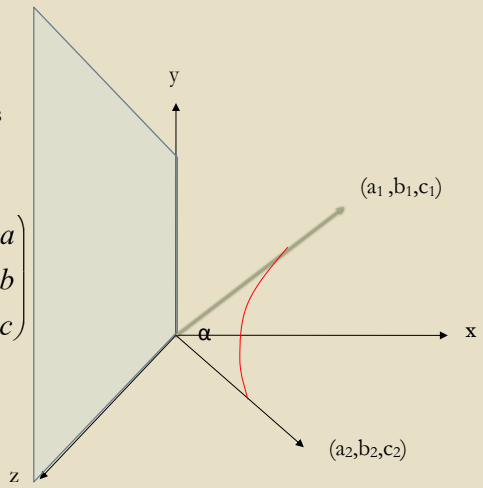
76

Rotation about an arbitrary axis

- Step 2

Rotate along x-axis

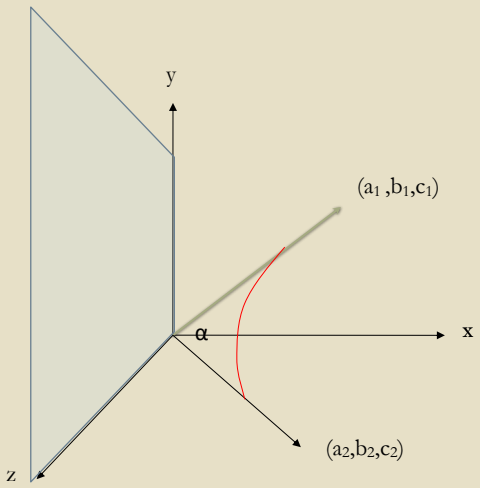
$$\begin{pmatrix} a_2 \\ b_2 \\ c_2 \end{pmatrix} = R_x(\alpha)T \begin{pmatrix} a \\ b \\ c \end{pmatrix}$$



Let the vector **lies in the xz plane!**

77

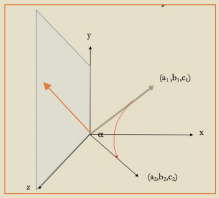
Rotation about an arbitrary axis



Let the vector **lies in the xz plane!**

78

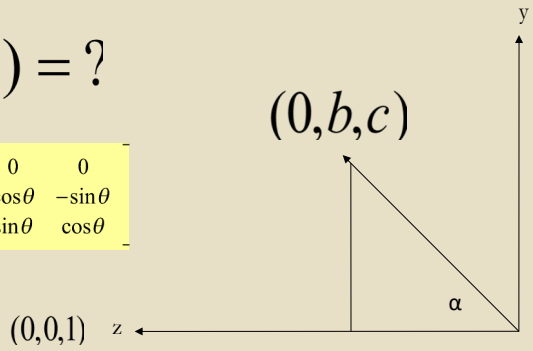
Closer Look at Y-Z Plane



- Need to rotate α degrees around the x-axis

$$R_x(\alpha) = ?$$

$$R_x(\theta) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{bmatrix}$$



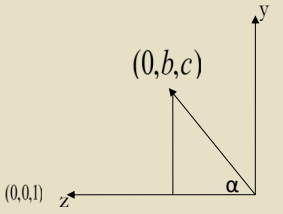
79

Equations for α

$$R_x(\theta) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{bmatrix}$$

||vxw||=||v|| ||w|| sinθ

v•w=||v|| ||w|| cos(θ)



$$\sin(\alpha) = \frac{\|(0,0,1) \times (0,b,c)\|}{\|(0,0,1)\| \|(0,b,c)\|} = \frac{b}{sqrt(b^2 + c^2)}$$

$$\cos(\alpha) = \frac{(0,0,1) \bullet (0,b,c)}{\|(0,0,1)\| \|(0,b,c)\|} = \frac{c}{sqrt(b^2 + c^2)}$$

80

$(0,0,1) \times (0,b,c)$

Matrix notation [edit]

The cross product can also be expressed as the formal[note 1] determinant:

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$$

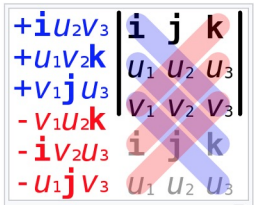
This determinant can be computed using Sarrus's rule or cofactor expansion. Using Sarrus's rule, it expands to

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= (u_2v_3\mathbf{i} + u_3v_1\mathbf{j} + u_1v_2\mathbf{k}) - (u_3v_2\mathbf{i} + u_1v_3\mathbf{j} + u_2v_1\mathbf{k}) \\ &= (u_2v_3 - u_3v_2)\mathbf{i} + (u_3v_1 - u_1v_3)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}. \end{aligned}$$

Using cofactor expansion along the first row instead, it expands to[6]

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= \begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix}\mathbf{i} - \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix}\mathbf{j} + \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix}\mathbf{k} \\ &= (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}, \end{aligned}$$

which gives the components of the resulting vector directly.



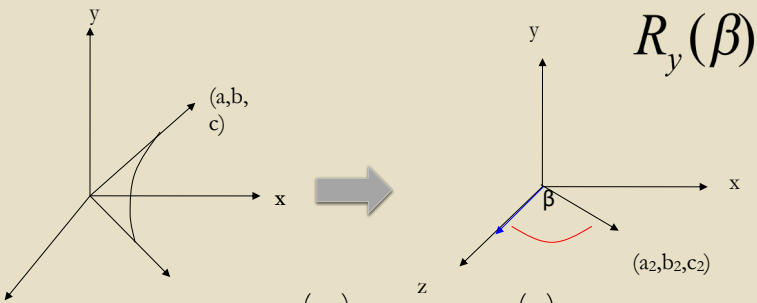
Use of Sarrus's rule to find the cross product of **u** and **v**

81

Rotation about the Y-axis

- Step3: Rotate along y axis

Using the same analysis as before, we need to rotate β degrees around the Y-axis



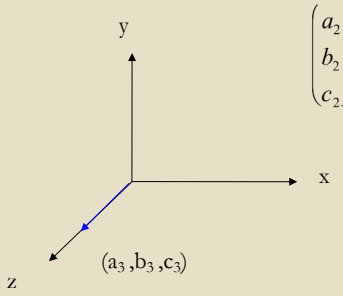
$$R_y(\beta) = ?$$

$$\begin{pmatrix} a_3 \\ b_3 \\ c_3 \end{pmatrix} = R_y(\beta)R_x(\alpha)T \begin{pmatrix} a \\ b \\ c \end{pmatrix}$$

82

Rotation about the Z-axis

- Now, it is aligned with the Z-axis, thus we can simply rotate θ degrees around the Z-axis.
- Then undo all the transformations we just did



$$\begin{pmatrix} a_2 \\ b_2 \\ c_2 \end{pmatrix} = R_z(\theta)R_y(\beta)R_x(\alpha)T\begin{pmatrix} a \\ b \\ c \end{pmatrix}$$

83

Equation summary

$$rot_{axis}(\theta) = \begin{pmatrix} a' \\ b' \\ c' \end{pmatrix} = T^{-1}R_x^{-1}(\alpha)R_y^{-1}(\beta)R_z(\theta)R_y(\beta)R_x(\alpha)T\begin{pmatrix} a \\ b \\ c \end{pmatrix}$$
